ATSC Candidate Standard: Captions and Subtitles (A/343)

ADVANCED TELEVISION SYSTEMS COMMITTEE

> Doc. S34-169r3 23 December 2015

Advanced Television Systems Committee 1776 K Street, N.W. Washington, D.C. 20006 202-872-9160 The Advanced Television Systems Committee, Inc., is an international, non-profit organization developing voluntary standards for digital television. The ATSC member organizations represent the broadcast, broadcast equipment, motion picture, consumer electronics, computer, cable, satellite, and semiconductor industries.

Specifically, ATSC is working to coordinate television standards among different communications media focusing on digital television, interactive systems, and broadband multimedia communications. ATSC is also developing digital television implementation strategies and presenting educational seminars on the ATSC standards.

ATSC was formed in 1982 by the member organizations of the Joint Committee on InterSociety Coordination (JCIC): the Electronic Industries Association (EIA), the Institute of Electrical and Electronic Engineers (IEEE), the National Association of Broadcasters (NAB), the National Cable Telecommunications Association (NCTA), and the Society of Motion Picture and Television Engineers (SMPTE). Currently, there are approximately 150 members representing the broadcast, broadcast equipment, motion picture, consumer electronics, computer, cable, satellite, and semiconductor industries.

ATSC Digital TV Standards include digital high definition television (HDTV), standard definition television (SDTV), data broadcasting, multichannel surround-sound audio, and satellite direct-to-home broadcasting.

Note: The user's attention is called to the possibility that compliance with this standard may require use of an invention covered by patent rights. By publication of this standard, no position is taken with respect to the validity of this claim or of any patent rights in connection therewith. One or more patent holders have, however, filed a statement regarding the terms on which such patent holder(s) may be willing to grant a license under these rights to individuals or entities desiring to obtain such a license. Details may be obtained from the ATSC Secretary and the patent holder.

This specification is being put forth as a Candidate Standard by the TG3/S34 Specialist Group. This document is an editorial revision of the Working Draft (S34-169r2) dated 9 November 2015. All ATSC members and non-members are encouraged to review and implement this specification and return comments to <u>cs-editor@atsc.org</u>. ATSC Members can also send comments directly to the TG3/S34 Specialist Group. This specification is expected to progress to Proposed Standard after its Candidate Standard period.

Version	Date
Candidate Standard approved Note that key points in this document are currently under consideration by TG3/S34. These points are identified as follows: - Yellow highlight indicates an editorial TBD (e.g., awaiting a document publication date) - Cyan highlight indicates a sections or item that is under development in S34 Feedback and comments on these points from implementers is encouraged.	23 December-2015
Standard approved	[date]

ATSC Candidate Standard: Captions and Subtitles

1. SCOPE

This standard defines the required technology for closed caption and subtitle tracks over ROUTE-DASH and MMT transports. This includes the content essence, the packaging and timing, and the transport-dependent signaling.

1.1 Organization

This document is organized as follows:

- Section 1 Outlines the scope of this document and provides a general introduction.
- Section 2 Lists references and applicable documents.
- Section 3 Provides a definition of terms, acronyms, and abbreviations for this document.
- Section 4 System overview
- Section 5 Content Essence description
- Section 6 Packaging and timing in the ISO BMFF
- Section 7 Signaling
- Section 8 Decoder Recommendations
- Annex A Live and Broadcast Boundary Considerations

2. REFERENCES

All referenced documents are subject to revision. Users of this Standard are cautioned that newer editions might or might not be compatible.

2.1 Normative References

The following documents, in whole or in part, as referenced in this document, contain specific provisions that are to be followed strictly in order to implement a provision of this Standard.

- [1] IEEE: "Use of the International Systems of Units (SI): The Modern Metric System," Doc. SI 10-2002, Institute of Electrical and Electronics Engineers, New York, N.Y.

3. DEFINITION OF TERMS

With respect to definition of terms, abbreviations, and units, the practice of the Institute of Electrical and Electronics Engineers (IEEE) as outlined in the Institute's published standards [1] shall be used. Where an abbreviation is not covered by IEEE practice or industry practice differs from IEEE practice, the abbreviation in question will be described in Section 3.3 of this document.

3.1 Compliance Notation

This section defines compliance terms for use by this document:

- **shall** This word indicates specific provisions that are to be followed strictly (no deviation is permitted).
- shall not This phrase indicates specific provisions that are absolutely prohibited.
- **should** This word indicates that a certain course of action is preferred but not necessarily required.
- **should not** This phrase means a certain possibility or course of action is undesirable but not prohibited.

3.2 Treatment of Syntactic Elements

This document contains symbolic references to syntactic elements used in the audio, video, and transport coding subsystems. These references are typographically distinguished by the use of a different font (e.g., restricted), may contain the underscore character (e.g., sequence_end_code) and may consist of character strings that are not English words (e.g., dynrng).

3.2.1 Reserved Elements

One or more reserved bits, symbols, fields, or ranges of values (i.e., elements) may be present in this document. These are used primarily to enable adding new values to a syntactical structure without altering its syntax or causing a problem with backwards compatibility, but they also can be used for other reasons.

The ATSC default value for reserved bits is '1.' There is no default value for other reserved elements. Use of reserved elements except as defined in ATSC Standards or by an industry

standards setting body is not permitted. See individual element semantics for mandatory settings and any additional use constraints. As currently-reserved elements may be assigned values and meanings in future versions of this Standard, receiving devices built to this version are expected to ignore all values appearing in currently-reserved elements to avoid possible future failure to function as intended.

3.3 Acronyms and Abbreviation

The following acronyms and abbreviations are used within this document:

ATSC - Advanced Television Systems Committee

BMFF – Base Media File Format

CEA – Consumer Electronics Association

CFF – Common File Format

DASH – Dynamic Adaptive Streaming over HTTP

DASH-IF – DASH Industry Forum

DECE – Digital Entertainment Content Ecosystem

EBU – European Broadcast Union

FCC – Federal Communications Commission

HTTP – Hyper-Text Transport Protocol

IETF – Internet Engineering Task Force

IMSC1 – Internet Media Subtitles and Captions Version 1

ISO – International Standards Organization

MMT – MPEG Media Transport

MMTP – MPEG Media Transport Protocol

MPD – Media Presentation Description

MPU – Media Processing Unit

SMPTE – Society of Motion Picture and Television Engineers

TT – Timed Text

TTML – Timed Text Markup Language

URI – Uniform Resource Identifier

USBD – User Service Bundle Description

W3C – World Wide Web Consortium

XML – Extensible Markup Language

3.4 Terms

The following terms are used within this document: **reserved** – Set aside for future use by a Standard.

3.5 Extensibility

This ATSC 3.0 specification is based on W3C IMSC1, an XML-based representation of captions. XML is inherently extensible and can be enhanced over time by ATSC retaining compatibility with earlier versions. For example, user systems can extend it using their own namespaces and retain compatibility with the core feature set defined here.

3.6 XML Schema and Namespace

The schema is available at W3C and the namespace is defined there. There are currently no ATSC-defined namespaces or schemas.

4. SYSTEM OVERVIEW

4.1 Features

The technology is SMPTE Timed Text (SMPTE-TT) as defined in SMPTE 2052-1 [9]. SMPTE-TT was chosen as it:

- Supports world-wide language and symbol tables (specifically including non-Latin)
- Supports world-wide image glyph delivery
- Is in use today by various "media delivery silos", including broadcaster OTT delivery
- Is US FCC closed caption safe harbor for IP-delivered content
- Supports FCC requirements for both 708¹ and IP captions
- Compatible with DECE (UltraViolet) Common File Format Timed Text (CFF-TT) at [13]

All of SMPTE-TT is complex and not required to meet closed captions and subtitle requirements. A simpler subset is desirable for practical implementation. Therefore, W3C's new "TTML Text and Image Profiles for Internet Media Subtitles and Captions (IMSC1)" [2] is selected having been designed specifically for needs like broadcast as well as broadband delivery. In summary:

- Superset of DECE/Ultraviolet CFF-TT (TTML + SMPTE-TT extensions)
- Two profiles are included
 - Text Profile requiring a font rendering engine in the decoder
 - Image Profile with PNG files

4.2 System Architecture

When present, the content essence for captions and subtitles is formed using one or more ISO BMFF track files each containing one or more XML documents. The XML documents conform to W3C TTML IMSC1 profiles as constrained and extended in this specification. Each track contains only one set of "timed text" corresponding to a set of metadata "signaling".

Signaling external to the track files is done using metadata in DASH MPD or MMT Signaling Message as defined in ATSC A/331 [7].

4.3 Central Concepts

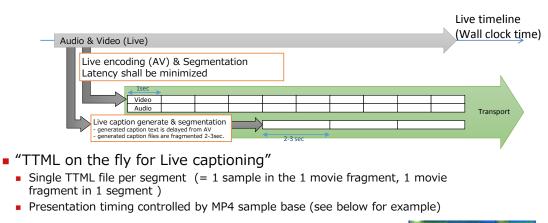

A tutorial on TTML in general and SMPTE-TT specifically can be found in SMPTE Webcasts at [10].

Examples of using TTML for US closed caption scenarios can be found in the underlying TTML1 specification at [11].

Additional background on using TTML1 for the conversion from CEA 608 [14] can be found in a W3C profiles, called SDP-US at [12].

A graphical description of timing for the live content scenario (see Section 6.3) is shown in Figure 4.1.

¹ Drop-shadow is not exact.

CC track	text1	text1	text2	null	
CC presentation	Text1	Text1	Text 2		

Figure 4.1 Live caption timing model.

5. CONTENT ESSENCE SPECIFICATION

The content essence for closed captions and subtitles shall be IMSC1 as defined at [2].

5.1 Extensions

This section contains extensions to the IMSC1 XML language.

5.1.1 3D

Extensions for 3D allow caption authors to correctly place caption regions over 3D video. When 3D disparity is used, it shall be as described in TTML2 at [6] Section 10.2.10.

When the disparity value is specified as a percentage of the video width format, it can scale properly for any resolution image. The range should be from +/-0.0% to +/-10.0% of picture width.

5.1.2 High Dynamic Range (HDR) & Wide Color Gamut (/WCG)

Extensions for HDR/WCG allow caption authors to use color space other than sRGB, the native color space of TTML.

[This section may be completed as ATSC reaches decisions on HDR for ATSC 3.0 and/or IMSC2 becomes available. Considerations for this document include:]

- ATSC HDR video decisions, including harmonization of metadata
- PNG signaling/encoding
- Logistics including:
 - Use of ATSC namespace of this extension
 - Propose ttml2:colorGamut (and maybe other attributes) to W3C

5.1.3 Other Extensions

[This section may be completed by S34 after appropriate discussions of the proposals have taken place :]

- Scaling region
 - The direction of expansion

- Expansion ratio relative to the original size
- Enhanced scrolling support
 - Scroll direction
 - The amount of scroll
- Play-out speed

6. PACKAGING AND TIMING IN THE ISO BASE MEDIA FILE FORMAT (ISO BMFF)

The content essence of Section 5 shall be packaged and conform to ISO BMFF Part 30 at [3], except as provided in Section 6.3. Content packaging shall further conform to DASH-IF Section 6.4.4 at [4].

For the delivery by MMTP, the content essence of Section 5 shall also conform to the constraints defined in Section 8.1.2.1.2 of ATSC's "Signaling, Delivery, Synchronization, and Error Protection" specification ATSC A/331 [7].

6.1 Pre-recorded Broadband Content

For broadband delivery, the DASH segment size shall be less than 500K bytes. This is needed to bound the amount of decoder memory needed to decode a document and also provide a reasonable startup acquisition time at the beginning of a program.

Note: The segment length can be the length of the program; i.e., a single file.

6.2 Pre-recorded Broadcast Content

For pre-recorded broadcast, caption segments (i.e. IMSC1 documents) should be relatively short in duration. This is needed to allow decoders to join an in-progress broadcast and acquire and present caption content concurrent with AV program content.

The time for acquisition and presentation of captions (if present at that moment) should be on the order of the time for acquisition and presentation of video and audio. The IMSC1 document duration therefore typically varies from ½ to 3 seconds. Longer IMSC1 documents, while being more efficient, could result in objectionable delays to the first presentation of caption content.

The IMSC1 timebase shall be "media".

Note: When fragmenting a caption file it is sufficient to just include all IMSC1 content elements that are active during the sample time period. This will, in the general case, result in begin and end times that are outside the sample duration. It is not necessary when fragmenting the file to clip the begin and end times. This overrides the recommendation in ISO BMFF Part 30 [3] Section 6.3.

6.3 Live Content (Broadband and Broadcast)

For live content, that is content that is authored in real time without prediction of the future layout (see Figure 4.1), packaging shall conform to the provisions in this section.

For broadcast, when MMTP is used, an MPU containing the content essence of Section 5 shall have only one sample, a single IMSC1 document per MPU.

Whether over broadcast or broadband, segments shall conform to the pre-recorded broadcast constraints of Section 6.2, as well as EBU Tech 3370 [5], Sections 1 - 2.4.1.

Note: There is no support for EBU-TT content extensions.

Each document shall initially recreate the Intermediate Synchronic Document (see W3C TTML1 [11]) at the end of the prior document. See Annex A.

When an IMSC1 content element's end time is coincident with the sample boundary, any such content elements shall be repeated in the following sample's first Intermediate Synchronic Document. This is needed for the decoder to observe the "scroll event" to properly manage smooth scrolling. Without this, the decoder would "jump scroll". See Annex A.

IMSC1 content elements should specify a maximum duration (i.e., not indefinite) up to 16 seconds. This will ensure that the text is automatically erased according to current industry practice (see CEA 608 [14], Section C.9) should there not be a follow on document, in order to avoid "stuck captions".

Note: Encoders can consider using the IMSC1 timebase="clock" (UTC or station local clock). This is to more easily allow geographically diverse locations for the caption authoring from the video/audio production and encoding.

7. SIGNALING

7.1 Metadata

The following closed caption metadata shall be signaled:

- Language: the dominant language of the closed caption text.
- Role: the purpose of the closed caption text; e.g., main, alternate, commentary.
- Display aspect ratio: the display aspect ratio assumed by the caption authoring in formatting the caption windows and contents.
- Easy reader: this metadata, when present, indicates that the closed caption text tailored to the needs of beginning readers.
- Profile: this metadata indicates whether text or image profile is used.
- 3D support: this metadata, when present, indicates that the closed caption text tailored for both 2D and 3D video.

7.2 Signaling on ROUTE/DASH

The signaling of closed caption codecs for the codec parameter in DASH MPD shall conform to DASH-IF Section 6.4.4 at [4].

The closed caption metadata shall be signaled by using descriptors as provided in DASH-IF Section 6.4.5 at [4]. Role, Essential Property and Supplemental Property descriptors shall be used.

The language attribute shall be set on the Adaptation Set and the Role element shall be used as necessary.

The Essential Property and/or Supplemental Property descriptors with the @schemeIduRI equal to "urn:atsc3.0:dash:cc:2015" and an @value attribute shall be used to signal the metadata associated to closed caption. The @value syntax shall be as described in the ABNF below.

```
@value = "ar" ":" aspect-ratio ["," easy-reader]["," profile] ["," 3d-support]
aspect-ratio = (%d1-%d99) "-" (%d1-%d99)
easy-reader = "er" ":" BIT; default value 0
profile = "profile" ":" BIT; default value 0 for text profile
3d-support = "3d" ":" BIT; default value 0
```

aspect-ratio may be set to any value pairs, including: "4-3", "16-9", and "21-9".

easy-reader shall be set as a Boolean value; it is set as '1' if present, otherwise the default is 0.

- profile shall be set as a Boolean value; it is set as '1' for image profile if present, otherwise the default is 0 for text profile.
- 3d-support shall be set as a Boolean value; it is set as '1' if the provisions of Section 5.1.1 are present, otherwise the default is 0.
- 7.3 Signaling on MMT

For broadcast, the closed caption metadata associated with closed caption assets ATSC A/331 [7] shall be signaled by using the caption_asset_descriptor() as given in Table 7.1 as the payload of an mmt_atsc3_message() as given in ATSC A/331 [7]. The semantics of the fields in the caption_asset_descriptor() shall be as given immediately below Table 7.1.

Syntax	No. of Bits	Format
caption_asset_descriptor() {		
descriptor_tag	16	uimsbf
descriptor_length	8	uimsbf
number_of _assets	8	uimsbf
for (i=0; i <number_of_assets; i++)="" td="" {<=""><td></td><td></td></number_of_assets;>		
asset_id_length	8	uimsbf
for (j=0; j <asset_id_length; j++)="" td="" {<=""><td></td><td></td></asset_id_length;>		
asset_id_byte	8	uimsbf
}		
language_length	8	uimsbf
for (j=0; j <language_length; j++)="" td="" {<=""><td></td><td></td></language_length;>		
language_byte	8	uimsbf
}		
role	4	bslbf
aspect_ratio	4	bslbf
easy_reader	1	bslbf
profile	2	bslbf
3d_support	1	bslbf
reserved	4	bslbf
}		
}		

Table 7.1. Bit Stream Syntax for caption_asset_descriptor()

- descriptor_tag This 16-bit unsigned integer shall have the value 0xTBD [Note: S34 will complete this TBD when tag assignment mechanisms that avoid collisions in the various ATSC 3.0 documents have been determined], identifying this descriptor as being the caption_asset_descriptor().
- **descriptor_length** This 8-bit unsigned integer shall specify the length (in bytes) immediately following this field up to the end of this descriptor.

number_of_assets – An 8-bit unsigned integer field that shall specify the number of caption assets.

asset_id_length – An 8-bit unsigned integer field that shall specify the length in bytes of the URI identifying the caption asset id.

asset_id_byte - An 8-bit unsigned integer field that shall contain a byte of the caption asset id URI.

- language_length An 8-bit unsigned integer field that shall specify the length in bytes of the language of the caption asset.
- language_byte An 8-bit unsigned integer field that shall contain a UTF-8 character of the language of the caption asset. The language of a caption asset shall be given by a language tag as defined by IETF BCP 47 [8].

role – A 4-bit field that shall specify the purpose of the closed caption text as given in Table 7.2.

role	Meaning
0x0	main
0x1	alternate
0x2	commentary
0x3~0xF	Reserved for future use

Table 7.2. Code Values for role

aspect_ratio – A 4-bit field that shall specify the display aspect ratio assumed by the caption author and as given in Table 7.3.

 Table 7.3. Code Values for aspect_ratio

aspect_ratio	Meaning
0x0	16:9
0x1	4:3
0x2	21:9
0x3~0xF	Reserved for future use

- profile A 2-bit field that when set to '01' shall indicate image captions, and when set to '00' shall indicate text captions. Field values '10' and '11' shall be reserved for future use.
- easy_reader A 1-bit field that when set to '1' shall indicate an easy reader closed caption asset, and otherwise not.
- **3d_support** A 1-bit field that when set to '1' shall indicate support for both 2d and 3d support as specified in the provisions of Section [?], and otherwise support for 2d video only.

Note: For broadband, the @ful1MPDUri attribute of the MMT USBD given in ATSC A/331 [7] provides the URI of an MPD fragment containing content component metadata. The closed caption metadata specified in section 7.1 can be included in the MPD fragment.

8. DECODER RECOMMENDATIONS

Decoders need to:

- Be able to decode and present both IMSC1 Profiles (text and image) content
- Support smooth scrolling as described in TTML1

Annex A – Live and Broadcast Document Boundary Considerations (Informative)

[S34 may complete this informative section to aid implementers in use of this document.]

End of Document
